PREAMBLE

Preamble

This Code of Practice (COP) is intended to help industry practitioners in understanding how to prepare multi-agency regulatory submissions across the key submission gateways in CORENET X.

The Code of Practice will include recommended procedures and good practices to address common Building Information Modelling (BIM) issues at general project collaboration level (e.g. multi-disciplinary project set-up, geo-referencing) and specific details that vary from firm to firm today.

The Code of Practice complements the IFC-SG Resource Kit (<https://go.gov.sg/ifcsg>), which provides technical templates and help resources from key proprietary BIM software for the generation of IFC-SG models.

Disclaimer

Section 1 and 2 of this Code of Practice details the envisaged end state of CORENET X. CORENET X is developed through Agile Methodology and hence, features and requirements mentioned in this COP will be developed progressively, and its technological enhancements will be made available in phases. For the exact implementation date, please refer to official circulars.

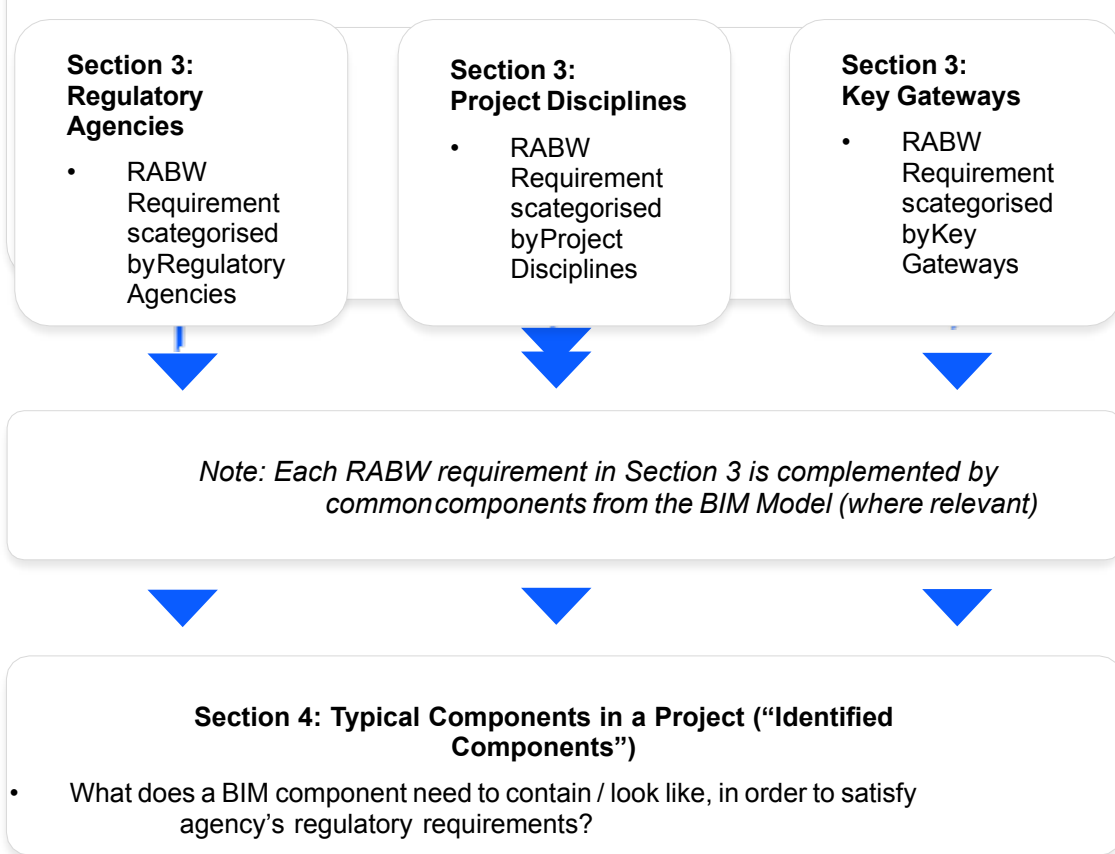

This Code of Practice does not substitute Handbooks, Circulars or other regulatory publications of our regulatory agencies. Readers should refer to the relevant Codes, Acts and Regulations on the compliance required for their projects, before referring to this Code of Practice on how to represent the compliance information in the CORENET X submission gateways.

Readers should consult relevant agencies if they need to determine the regulatory requirements to fulfil compliance.

Feedback

The Code of Practice will be updated progressively from its May 2023 draft release for industry comments before Version 1 Release. We welcome your comments and queries about the Code of Practice so that we can continue to develop and improve it. Please provide your inputs at <https://go.gov.sg/cx-cop-comments>.

How to use this Code of Practice

Note: CORENET X is developed through Agile Methodology and sections / requirements in this COP will be updated progressively and its technological enhancements will be made available in phases.

Section 2: General Requirements

- Which agency’s approvals are covered under CORENET X?
- What do abbreviations like RABW and IFC-SG stand for?
- What happens to the QP’s statutory obligations under CORENET X?
- What is each project team submission like and maximum file size?
- What is the model preparation process like?

SECTION 1

Introduction to CORENET X

1. Introduction to CORENET X

	Page
Overview of CORENET X	
• Today's Separate and Concurrent Approval Process	9
• Tomorrow's Envisaged Streamlined Regulatory Approval Process	10
CORENET X User Journey	11

About

Harnessing the power of digitalisation and technology, CORENET X will allow Qualified Persons (QPs, i.e. professional engineers and registered architects) to submit a three-dimensional model of a development or building - created and developed digitally through Building Information Modelling (BIM) to the regulatory agencies.

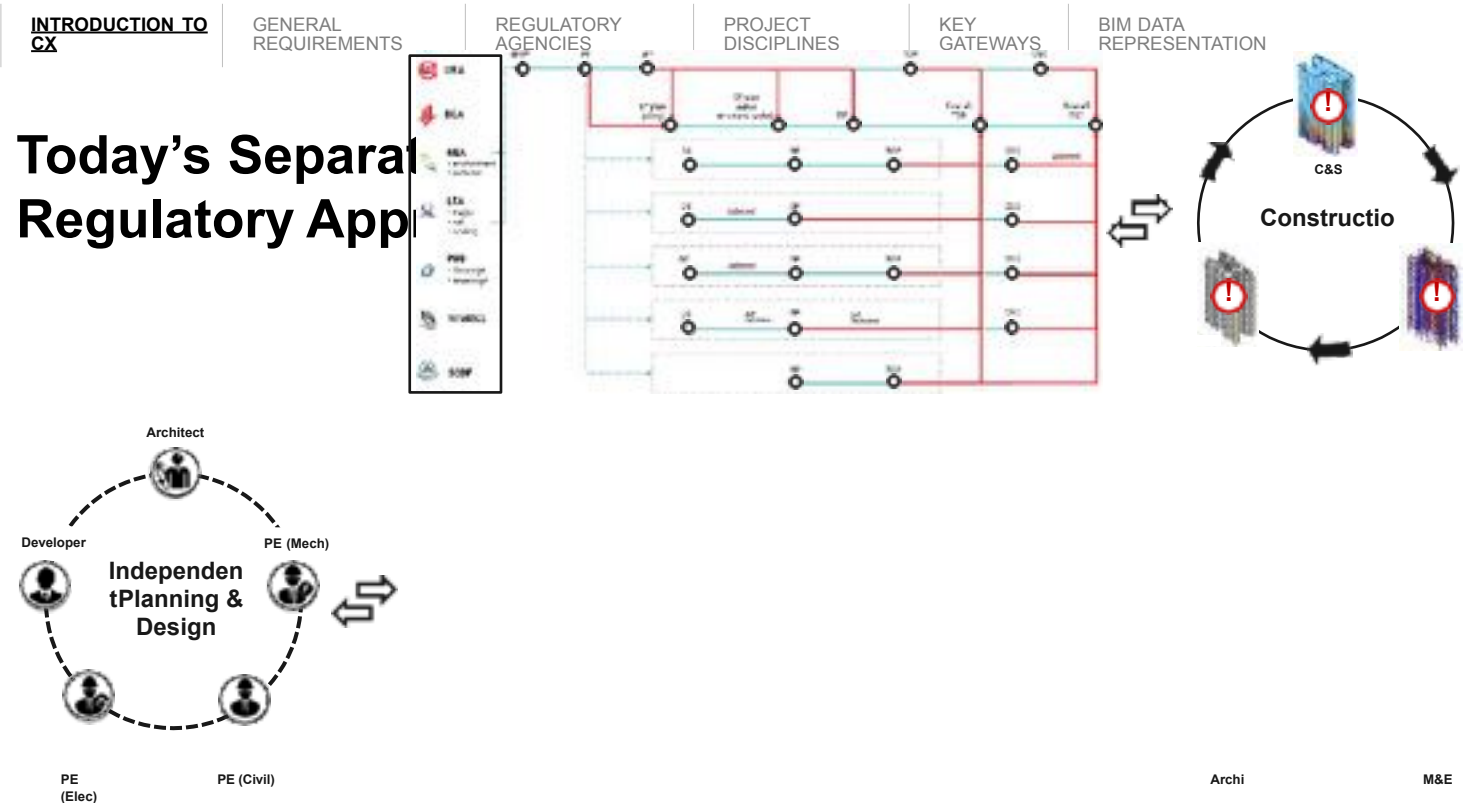

It allows the project team, which includes the QPs, to collaborate and review their designs in the model together, detect possible major conflicts before construction, and produce a coordinated BIM model for submission and regulatory approval. It changes the current practice of QPs dealing separately with multiple regulatory agencies, and producing different versions of building plans thereafter.

Led by BCA and URA and supported by GovTech, CORENET X was developed in close collaboration with the other public agencies¹ and leading built environment professionals, firms, and Trade Associations and Chambers (TACs). It is slated for implementation by the end of 2023.

See also:

[Minister \(MND\)'s Official Announcement of CORENET X at the International Built Environment Week 2021](#)

¹CORENET X comprises of the following public agencies: BCA, URA, GovTech, HDB, JTC, LTA, NEA, NParks, SCDF and SLA.

independently

- Plans are **submitted separately** to different agencies at different milestones concurrently

- Comments from one agency may lead to **resubmission/ amendment** to others
- Approved plans can be **conflicting; no single integrated view** of the approved plan

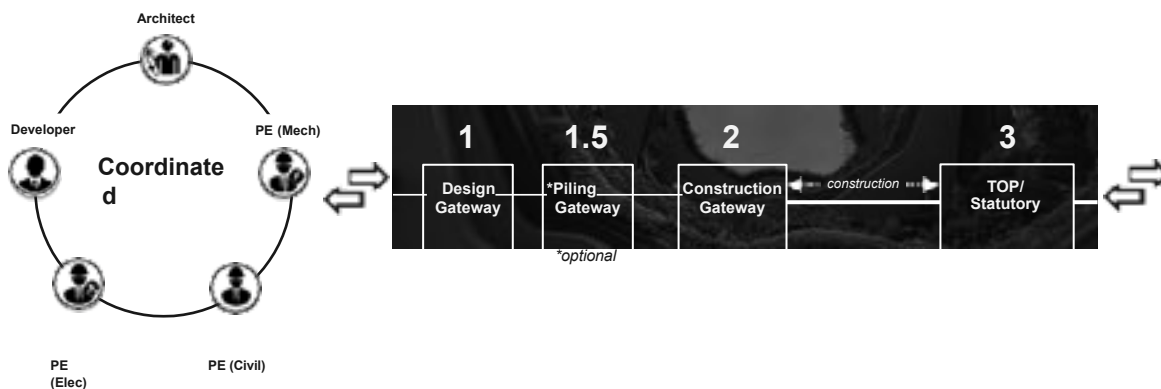

during construction

- Rectifications = **Abortive Works**
- Delayed issuance** of TOP/CSC

A key impetus for change is because of today's fragmented approval process. In today's process, the industry prepare submissions independently, and they then submit these plans separately to the different regulatory agencies.

This silo working environment is not conducive for coordinated design and regulatory reviews upstream, which often results in iterative submissions as well as conflicting or disjointed building information downstream during construction. This leads to abortive works, or resubmissions which delays TOP/CSC, ultimately affecting construction productivity.

Tomorrow's Envisaged Streamlined Regulatory Approval Process

Industry

upstream

- Industry will need to **collaborate upfront with one another prior to submission**
- The Qualified Persons (QPs) will **submit Coordinated BIM Models** at the Gateways instead of submitting independently

Construction

downstream

- Over 20 approval gateways have now been streamlined to **3 Key Gateways: Design, Construction, Completion**
- These gateways are major submission milestones, where the submitted design needs to comply with cross-agencies' statutory requirements.
- Agencies will review the Coordinated BIM models together in a common data environment.
- Construction rectifications arising from competing regulatory requirements would be minimised as major conflicts would have been surfaced and resolved upstream prior to construction.

We wanted to radically rethink how the regulatory services can be delivered in a project centric manner, instead of today's silo manner. In tomorrow's process, industry will submit coordinated BIM models to the agencies for review, instead of submitting independently. The earlier 20 over approval gateways have now been streamlined to **3 key gateways**.

13

SECTION 2

General Requirements

2. General Requirements

	Page
Terms of Definitions	14
QP's Statutory Responsibilities, Multi-Disciplinary Coordination and Geo-Referencing	15
Typical Submission Package at a Single Gateway	16
IFC-SG Model Preparation	
• Preparing Models for Submission	17
• Top 3 Common Challenges and Solutions	24
• 3 rd Party Application to help with Preparation of IFC-SG Models	25

While the regulatory approval process is being redesigned to improve the current user experience to navigate across multi-regulatory agencies, the regulatory agencies' respective mandate and regime **remains unchanged**.

The current Development Control ("DC") and Building Plan ("BP") submissions, typically referred to by the agencies and industry, are now being mapped and consolidated under the Gateways of the new process. The amount of information required at the respective Gateways is also being recalibrated across the regulatory agencies to ensure that it is aligned with the intent of each Gateway.

Terms and Definitions

For the purpose of this Code of Practice, the following definitions shall apply:

Term	Definitions
RABW	Abbreviation for "Regulatory Approval Process for Building Works" ➤ Refers to the new sequential process related to CORENET X Gateways. More information of the RABW can be found here .
Gateways	Major submission milestones in CORENET X, where the submission needs to comply with multiple agencies' statutory requirements.
Supporting Mechanisms	Similar to today, there are 3 supporting mechanisms will continue to complement the approval process: <u>1. Pre-Submission Consultation</u> <ul style="list-style-type: none"> Pre-submission consultation will continue to be available for industry to consult or seek clarification prior to submission. <u>2. Waivers</u> <ul style="list-style-type: none"> Where necessary, the industry may apply for waiver under the respective Act and Regulations and the respective agency will assess the applications accordingly. <u>3. Escalation Mechanism</u> <ul style="list-style-type: none"> Industry can table their case to seek resolution on inter-agency regulatory conflicts at the Inter-agency Coordinating Committee (IACC)
Federated Model	Combined Building Information Model that compiles multiple models from different disciplines or sections of the project into a single, complete model of the project. <ul style="list-style-type: none"> Federated models support concurrent authorship of different aspects of the project by multiple parties. Federated models also support multi-disciplinary coordination as models are geo-referenced to coordinates from the Singapore SVY21 coordinate system (EPSG: 3414) for Easting and Northing (x,y) and Singapore Height Datum (SHD) for Height (z).
IFC-SG	New representations for local regulatory requirements, in the Industry Foundation Classes (IFC) openBIM standard. More information of the mapping and configuration files for IFC-SG can be found here .
Level of Details	As long as relevant IFC-SG data requirements are embedded in the respective BIM components and minimum dimensions represented, BIM components do not need to replicate their real-life equivalent. For example, trees can be represented as a lollipop object as long as IFC-SG parameters like "Girth", "Height" and "Status" are represented.
Non-BIM submissions	Besides BIM submissions in the IFC-SG format, CORENET X will be able to accept non-BIM submissions.

Supplementary Documents	CORENET X will be able to accept non-BIM documentations that accompany each project team's submission of IFC-SG models (e.g. design calculation reports, 2D detail drawings)
--------------------------------	--

For example, the Architectural Door should not have a design clash with the Structural Beam

	Architectural					Structural				
	Floor (Flooring)	Wall (Floorwall)	Ceiling (Floorceiling)	Door (Floordoor)	Window (Floorwindow)	Structural Column (Floorcolumn)	Structural Foundation (Floorfoundation)	Structural Framing (Floorbeam)	Structural Wall (Floorwall)	Sub (Floor)
Structural	Structural Column (Floorcolumn)			1						
	Structural Foundation (Floorfoundation)									
	Structural Framing (Floorbeam)									
	Structural Wall (Floorwall)									
	Sub (Floor)									
	Generic Models (Floor, ceiling, wall, etc.)									
MEP	Mechanical Equipment (Floor, ceiling, wall, etc.)	2								3
	Trunk (Floor, ceiling, wall, etc.)	4								5
	Air Treatment (Floor, ceiling, wall, etc.)									6
	Pipes (Floor, ceiling, wall, etc.)									7
	Building Systems (Floor, ceiling, wall, etc.)									8
	Cable Tray (Floor, ceiling, wall, etc.)									9

REPRESENTATION

QP's Statutory Responsibilities

While the regulatory approval process is being redesigned to improve the current user experience to navigate across multi-regulatory agencies, the regulatory agencies' respective mandate and regime remains unchanged. Hence, the statutory responsibilities of the appointed QPs under the respective Acts and Regulations **remains unchanged**.

Under the RABW, part of the process requires joint submission by the relevant QPs within the project teams to the relevant regulatory agencies. To ensure clear delineation of responsibilities, the developer (or whoever is required under the respective Acts and Regulations) needs to first appoint the QP for the respective areas of work at the start of a project. The appointed QP will then be responsible for the relevant aspects of the submission.

Multi-Disciplinary Coordination and Geo-Referencing

Prior to submission, models by the relevant disciplines should be coordinated, and the project team should ensure key components from each discipline do not clash with one another, as indicated in the matrix below.

S2 – Fig 2: Multi-Disciplinary Coordination

Besides discipline-specific models, it may be necessary to divide the project into separate parts, zones and levels for better management of the model sizes, especially for larger and more complex projects. As a good practice, this should be agreed and documented by the project team as early as possible.

These separate BIM models should be geo-referenced, by assigning real-world coordinates from the Singapore SVY21 coordinate system (EPSG: 3414) for Easting and Northing (x,y) and the Singapore Height Datum (SHD) for Height (z).

Typical Submission Package at a Single Gateway

Note: This is an example of a typical submission package, and is not exhaustive.

Examples	Architecture	C&S Engineering	M&E Engineering
IFC-SG models, all geo-referenced	<ul style="list-style-type: none"> Blk 1 Model Blk 2 Model Podium Model 	<ul style="list-style-type: none"> Blk 1 Model Blk 2 Model Podium Model Substructure Model <p>Note: For projects which did not opt for Piling Gateway (G1.5), the project team will need to include all permanent foundation works in Construction Gateway (G2).</p>	<ul style="list-style-type: none"> Blk 1 and Substructure Model Blk 2 and Substructure Model Podium
2D drawings	<ul style="list-style-type: none"> Details (e.g. household / storey shelter documentation and detailing) External Works 	<ul style="list-style-type: none"> General notes Special details (e.g. slab reinforcement detailing, complex structure detailing, precast joints, prestressed details, steel connections) External Works 	<ul style="list-style-type: none"> Details (e.g. cooling tower documentation and detailing) External Works

Pre-consultation document	-	Completion letter of pre-consultation (for complex structure only)	-

Preparing Models for Submission

Model Size

The total size of all models in a single submission package should not exceed 2GB. For huge developments that need to arrange their projects into different packages, please carry out a pre-submission consultation to seek agencies' concurrence for the proposal.

To help all project members understand the timing and delivery of data for every CORENET X submission, it is important to define the submission preparation and delivery details in the BIM Execution Plan. For more information, please refer to the BIM Essential Guide for BIM Execution Plan [here](#).

Setting up Project Information / Title Block

The Project Title, Address, QP Name & Professional Registration Number, and if applicable, Name & Professional Registration Number of Specialist QPs will be provided on the CORENET X Portal. It is not necessary to indicate this information in the IFC-SG model. However, all IFC-SG models shall provide the project information listed below as project parameters:

- Project reference
- Project nature (optional)
- Maximum number of building storeys
- Piling design parameters (if applicable)

Modelling in IFC-SG

- Most of the IFC parameter requirements are based on the international IFC 4 standards. A set of IFC-SG standards was developed to address specific regulatory requirements in Singapore that currently cannot be found in the international IFC standards.
- There are also IFC-SG parameters that had been defined & standardized to incorporate the current 2D drawings information and embedded in 3D models.
- A complete set of IFC-SG model shall consist of elements as described in [Section 4](#) of this COP. For example, a structural model can comprise of the following:

- | | |
|--------------|--------------|
| ○ Piles | ○ Walls |
| ○ Footings / | ○ Slabs |
| Pilecaps | ○ Staircases |
| ○ Beams | ○ Boreholes |
| ○ Columns | |

- Industry practitioners shall use IFC-SG configurator files as provided in the [IFC-SG Resource Kit](#) to convert Native BIM models into IFC-SG models and verify no data loss occurred during the exporting.
- Details can be represented in 2D to supplement the IFC-SG model, such as:
 - Irregular pilecaps, raft foundation, slab elements, household shelter / storey shelter elements, transfer plates, precast elements, prestress elements, PPVC modules, steel connections.

INTRODUCTION

GENERAL
REQUIREMENTS

REGU
AGEN

Preparing Models for

Reading the IFC-SG Mapping

- ✓ Know the element and its category
- ✓ What system it belongs to?
- ✓ What are the IFC Parameters that needs to map into it?
- ✓ To what Agency it will be submitted?

Agency	System	Category	IFC Class	IFC Name	IFC Description	IFC Parameters	IFC Mapping
...

S2 – Fig 3: IFC-SG Mapping

Setting up the Model

Upgrading the current in-house BIM Template into CORENET X Template

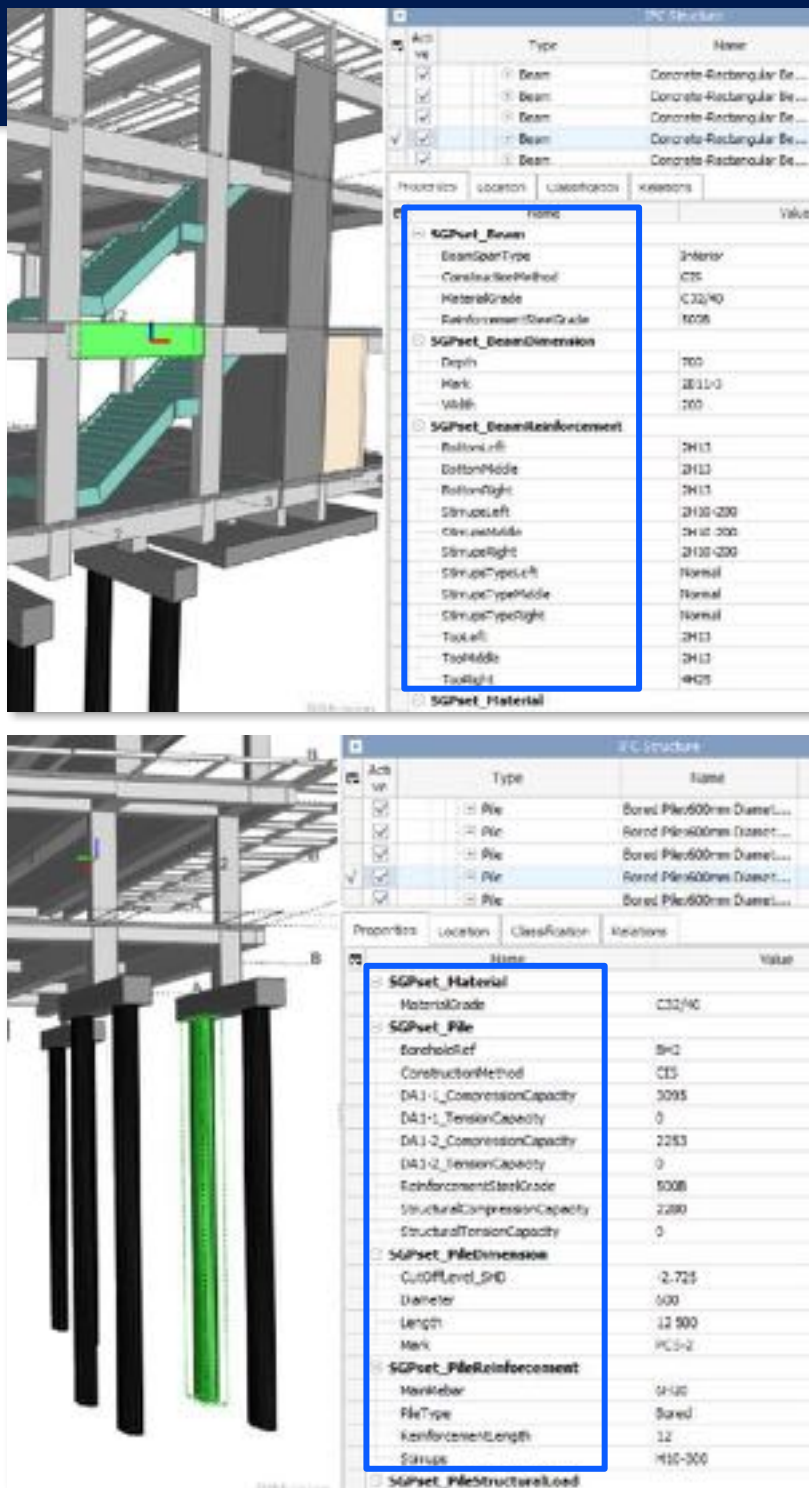

- ✓ Study the existing object properties
- ✓ Know the properties that needs to be edited in-line with the IFC Configurator

Pull out the common properties and assign as the object type properties

- ✓ To avoid re-entering of properties.
- ✓ To avoid duplication of property when exported into IFC

Map the existing object library properties into configuration file

- ✓ One-time process
- ✓ Can be used into the future projects
- ✓ Eliminate duplicated work and errors
- ✓ Standard IFC exports for all your projects

Top 3 Common Modelling Challenges and Solutions

Example using Revit Configuration File

(*Note to readers: Archicad, Tekla and OpenBuilding examples will be shown in future for each discipline)

Challenge 1

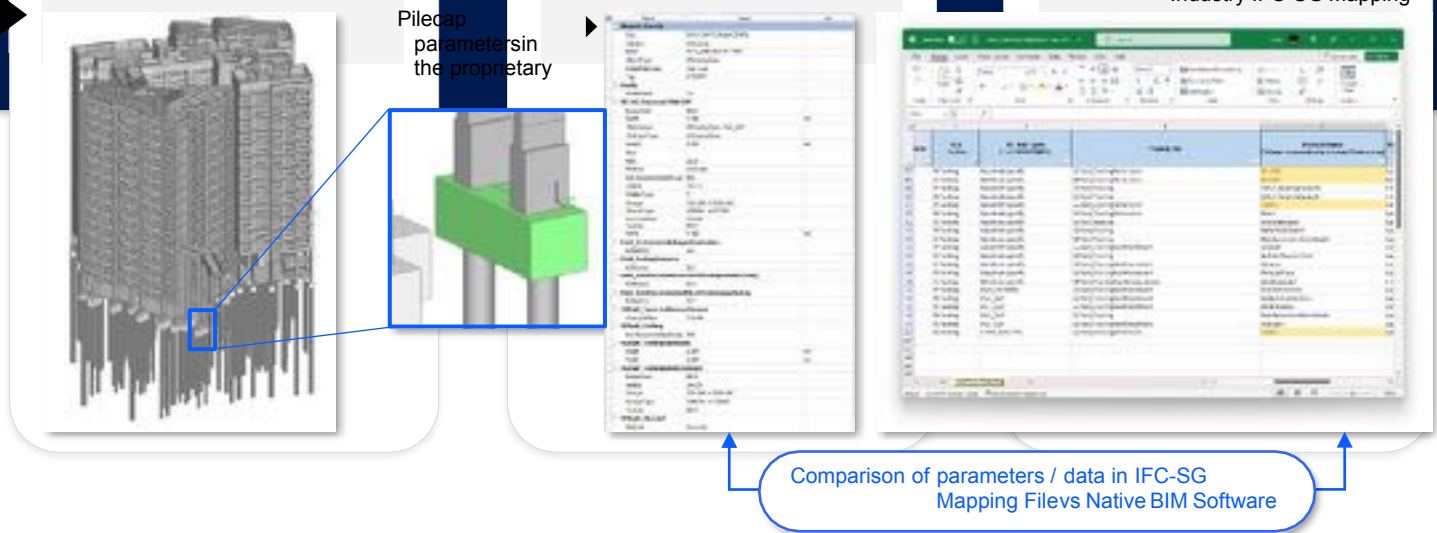

Challenge	Implications	Solutions
Accidentally spelling IFC property wrongly e.g. ✓ IfcTank ✗ IfcTanl ✗ ifctank	➤ Missing data in IFC	✓ Avoid manual typing where possible
	<ul style="list-style-type: none"> IFC properties cannot be exported Existing in-house properties notmapped properly (to wrong IFCproperties), thus also can't be exported 	<ul style="list-style-type: none"> Use BIM Interoperability Tool, selectfrom drop down list Copy Paste the information from IFC-SGIndustry Mapping (.XLS file from GovTech)

Challenge 2

Challenge	Implications	Solutions
Forgetting to update IFC afterchanges / modifications to model	➤ Missing data in IFC	✓ Check Mapping
	<ul style="list-style-type: none"> IFC properties cannot be exported Existing in-house properties notmapped properly (to wrong IFCproperties), thus also can't be exported 	<ul style="list-style-type: none"> Redo the mapping Use Schedule to cross check if all elements were tagged properly.
		✓ Avoid manual typing where possible
		<ul style="list-style-type: none"> Use BIM Interoperability Tool, selectfrom drop down list Copy Paste the information from IFC-SGIndustry Mapping (.XLS file from GovTech)

Challenge 3

Challenge	Implications	Solutions
Cannot export Revit linked files to a federated IFC (modelwith multiple link files) e.g. MEP sub-discipline models	➤ Missing data in IFC	✓ Today
	<ul style="list-style-type: none"> Assigned systems will be lost IFC properties cannot be exported Existing in-house properties notmapped properly (to wrong IFCproperties), thus also can't be exported 	<ul style="list-style-type: none"> Tag information after binding models Use Group Models instead of Binding Avoid binding if possible (i.e. exportlinked files one by one)
		✓ Future
		<ul style="list-style-type: none"> Through CORENET X community of practice, we have feedback to Autodeskto enable export of federated IFC Autodesk shared that this is part of theRevit Roadmap and will be included progressively in early 2023

3rd Party Application to help with Preparation of IFC-SG Models

Example using IFC-SG Validator

(*Note to readers: DiRoots and more will be shown in future)

How does it work?

- The IFC-SG validator extracts all elements from the model and check whether IFC-SG parameters have been added to the corresponding BIM components in the model. This helps to check whether the QP have missed out any IFC-SG parameters when mapping IFC-SG data into the proprietary BIM model earlier.

Setting up the IFC Model

Pre-Requisite

- ✓ IFC Model
- ✓ IFC-SG Mapping File(Optional). Can be found in the [IFC-SG resource kit](#).

Preparing the Model

- ✓ Input parameters into model.
- ✓ Instructions can be found in the [IFC-SG resource kit](#).

Validation Overview

Go to: <https://www.code.builtsearch.com/ifcsg-validator>

- ✓ Upload IFC Model
- ✓ Upload IFC-SG Mapping file (Optional)
- ✓ View Result

Link:
[IFC-SG Resource Kit](#)

Step 1

Go to: <https://www.code.builtsearch.com/ifcsg-validator>

- ✓ Click on 'Upload IFC' and select an IFC

3rd Party Application to help with Preparation of IFC-SG Models

Example using IFC-SG Validator

(*Note to readers: DiRoots and more will be shown in future)

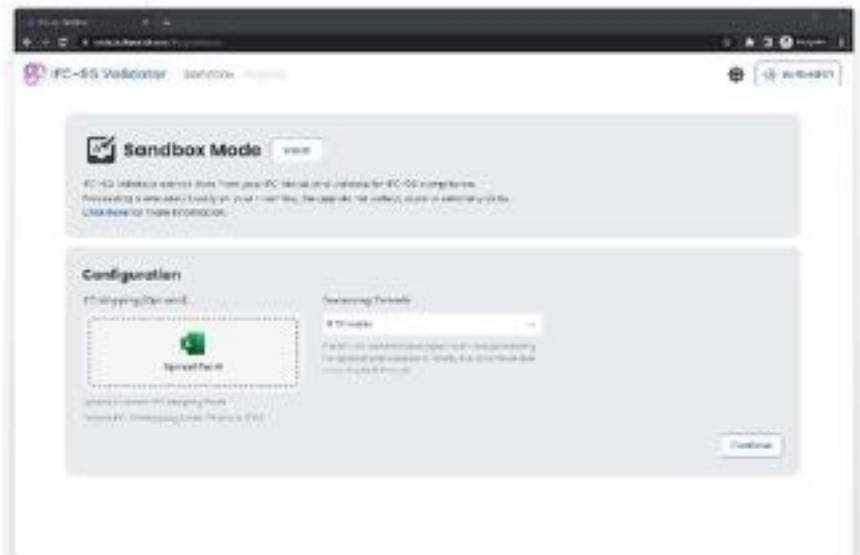

Guide to use the IFC-SG Validator Application

Note:

Work best on chromium-based browser (Microsoft Edge, Chrome, Brave, etc.) and Mozilla Firefox. For extremely large model >400mb, Firefox is preferred to avoid memory limit for chromium browser. All versions of Internet Explorer is not supported.

Step 2

- ✓ By default, IFC-SG Validator uses the latest IFC-SG Mapping file from [IFC-SGresource kit](#)
- ✓ To use a different Mapping table, upload your version of IFC-SG Mapping file.
- ✓ Leave processing threads as

Note:

For extremely large model >400mb and when using chromium browser, lower processing threads to 2-3 to avoid hitting memory limit, which will crash the browser.

Link:
[IFC-SG Resource Kit](#)

Step 4

- ✓ By clicking on the download button, you will download a JSON file of this model's IFC-SG Validator result, which can then be uploaded on the home page.
- ✓ This will load the result immediately without processing the model again.
- ✓ View results
- ✓ The score should not be taken at face

The TPZ established should be able to protect the entire tree throughout the duration of construction. The objective of the TPZ is to minimize the impact of construction activities on trees, including but not limited to mechanical injury to roots, trunks and branches due to contact with equipment, materials, debris or other activities. It also aims to minimize compaction of soil, which results in poor functioning of roots, and changes in soil levels that can cut off or suffocate roots. 		<ul style="list-style-type: none"> Tree Planting Area

Section 3: Specific Requirements by Key Gateways

G	Gateways	Objectives
G1	Design Gateway (DG) For Design Parameters	To resolve multi-agency key parameters which have impact on design parameters and client's brief, before proceeding to detailed design.
G1.5	Piling Gateway (PG) *optional	To resolve requirements pertaining to piling and foundation works (e.g. pile caps, raft foundation, earth retaining and stabilising structures), excluding superstructural works.
G2	Construction Gateway (CG)	To resolve multi-agency requirements concerning design details that need to be coordinated before commencement of main structural works and launch of Sales.
-	Independent Submissions (IDP) *if applicable	To clear agency-specific requirements with no cross-agency dependencies (i.e. typically affecting only one relevant agency). E.g. structural submission of ancillary structures such as barriers/claddings to BCA
G3	Completion Gateway (TOP) Application for TOP/CSC	To document "As-Built" plans and obtain Occupancy Permit/ Statutory Completion

Construction Gateway

Key milestone in the new Regulatory Approval Process for Building Works (RABW)

The Construction Gateway (G2) is a consolidated clearance containing agencies' building plan and detailed plan approvals in a single coordinated submission. The Written Permission (WP), Building Plan (BP) approval and Structural (ST) approval for all permanent super-structural design are issued in this gateway.

Construction Gateway (G2) Clearance is also required for the launch of sales and commencement of super-structural works.

External Works

External works (works adjacent to the site boundary) are to be coordinated and submitted as part of the Construction Gateway (G2) to agencies. Details include:

- Drainage and sewer improvements
- Roadside planting, reinstatement of landscaping
- Road improvement, provision of pedestrian facilities

External works details can be submitted in the 2D CAD format.

URA	<ul style="list-style-type: none"> Declaration that completed works have been supervised and built in accordance to approved plans Inspections (where necessary) 	

Application for Completion of Works

A set of TOP / CSC checklist pertaining to agencies' requirements are provided to guide the project teams on the list of requirements for TOP / CSC application. This includes as-built plan submissions, record plans, certificate of supervision, post-construction reports e.g. hydrostatic tests, RC trench report etc.

Site Inspections

Similar to today's practice, inspections would be carried out separately by agencies. Once agencies are notified on the project's readiness for TOP / CSC, agencies will inform the project team if an audit/inspection is required. This is to help project teams plan / prepare their site early.

TOP/CSC application

The status of each agencies' TOP / CSC would be tracked through CORENET X where the overall TOP / CSC by BCA will only be released when all agencies' respective clearances are obtained.

Modeling Accessible Route in IFC-SG

- This component can be modelled with Generic Models (Revit), Model Element (ArchiCAD), or Object (OpenBuildings) functions in the respective Native BIM software.
- Other components that could be viewed with Accessible Route may include: Lift, Ramp, Slab, Space, Vehicular Parking, if they contain a positive BarrierFreeAccessibility property

Beam

Modeling Beam in IFC-SG

- All the beam elements shall be modelled in IFC-SG model with the necessary information required as stipulated in the tables below.
 - Typical beams are allowed to have same marks and design information. All marks and design information have to be embedded in every beam element.
 - Multiple beams elements shall be modelled from support to support for beams with continuous spans.
- 2D detail drawings are allowed for any irregular or complex beam design (e.g. transfer beams, precast beams, prestressed beams, cold-form steel beams, etc.) with the indication of drawing number in the IFC-SG parameter "ReferTo2DDetail".

Beam Property Definition

Beam Property Definition	
1	Every beam will be detailed based on 3 parts (left, middle & right) in accordance to its local building axis orientation (refer to Figure 5 below).
2	Starting point of a beam should be the smallest x coordinate of local building axis orientation in a span and denoted as left part of a beam.
3	Behaviour of the beam (single, end, interior & cantilever span) shall be indicated in the parameters called "BeamSpanType". Limitation of inputs for this parameter is applied. Please refer to list of input.

Footing / Pilecap

Modeling Footing / Pilecap in IFC-SG

- All the footing / pilecap elements shall be modelled as independent elements* in IFC-SG model with the necessary information required as stipulated in the tables below.
 - For footing and pilecap with the same foundation design, they are allowed to have same marks and design information. All marks and design information have to be embedded in every footing / pilecap element.
- 2D detail drawings are allowed for any irregular or complex footing/pilecap design (e.g. 3 pile group, stair core pile group, etc.) with the indication of drawing number in the IFC-SG parameter "ReferTo2DDetail".

**Independent elements refers to elements with no combining or grouping of piles, pilecaps, footings or columns as one family type or generic element*

Footing / Pilecap Dimension and Reinforcement Definition

Footing / Pilecap Dimension and Reinforcement Definition	
1	<p>The breadth is referring to the longest side of a footing / pilecap while width is referring to the shorter side of a footing / pilecap, despite of its element orientation.</p>
2	<p>The input for TopMain, TopDistribution, BottomMain & BottomDistributionshall be "HXX-XXX" while "H" is a must, XX is thelongitudinal reinforcement diameter and XXX is the spacing of longitudinal reinforcement.</p> <ul style="list-style-type: none"> Use '+' for more than 1 layer of reinforcement (e.g. H32-150+H25-150) <p style="text-align: center;"> S4 – Fig xx : Beam Part </p>
3	<p>The input for Stirrups shall be "HXX-XXX-XXX" while "H" is a must, XX are the transverse reinforcement diameter and XXX is thespacing of transverse reinforcement.</p> <ul style="list-style-type: none"> Indicate the longitudinal spacing (main direction) and follow with transverse spacing (distribution direction) (e.g. H8-100-100) <p style="text-align: center;"> </p>

Pile

S4 – Fig 46 : Pile

S4 – Fig 47 : Pile in relation to Building

Modeling Pile in IFC-SG

- All the pile elements shall be modelled as per true coordinates in the IFC-SG model with the necessary information required as stipulated in the tables below.
 - Piles with same foundation design are allowed to have same pile marks and design information. All the pile marks and design information have to be embedded in every pile element.

By IFC Representation

IFC Entity: IfcPile						
IFC USER-DEFINED SubType: N.A.						
S/N	IFC-SG Property	Property Type	Type of Elements	Unit	Input Limitation	Examples

Greenery	NParks	<u>Conservation of Trees /Plants (Tree Protection Specifications)</u> <ul style="list-style-type: none"> The Certified Arborist engaged by the Developer is to provide a report of the trees to be conserved, with indication of the tree girth (minimum tree protection zone will be generated in CORENET X) A Tree Protection Zone (TPZ) refers to an area identified to protect the entire tree, which includes its crown, trunk and roots system. The TPZ established should be able to protect the entire tree throughout the duration of construction. The objective of the TPZ is to minimize the impact of construction activities on trees, including but not limited to mechanical injury to roots, trunks and branches due to contact with equipment, materials, debris or other activities. It also aims to minimize compaction of soil, which results in poor functioning of roots, and changes in soil levels that can cut off or suffocate roots. 	
Infra & Utilities (External)		<u>Allowable Structures within Planting Areas</u> <ul style="list-style-type: none"> Planting Areas (green buffers, peripheral planting verges) should be free from any encroachment, except for allowable minor ancillary structures and landscaping features listed in NParks Guidelines (Chapter 3)

S4 – Fig 61 : Fire Engine Accessway

- Refers to for carriageways, driveways, fire engine accessways, fire engine access roads and vehicular service roads for refuse collection vehicles, differentiated by IFC-SG properties
- The IFC Subtype for roads in the development should be defined as “DRIVEWAY”
- For “RoadCategory” property, the IFC Subtype “GIS_CARRIAGEWAY” is optional
- It is optional to indicate 3D arrows on the road as Egress and Ingress properties must be accurately indicated
- There are ongoing studies on replacing the IFC entity from *IfcCivilElement* to *IfcSpace* due to the changing gradients in a road component.

Slab

Modeling Slab in IFC-SG

- All the slab elements shall be modelled in IFC-SG model with the necessary information required as stipulated in the tables below.
 - The nominal reinforcement for slab shall be indicated in IFC-SG parameters. Additional reinforcement to be represented in 2D drawings.
 - Civil defence shelter slab will need to be indicated as “Yes” in IFC-SG parameter “ShelterUsage” and substantiate with civil defence shelter reinforcement details in 2D drawings.
- 2D detail drawings are allowed for all slab reinforcement drawings with the indication of drawing number in the IFC-SG parameter “ReferTo2DDetail”.

Slab Dimension and Reinforcement Definition

Slab Dimension and Reinforcement Definition	
1	QP can produce a set of 2D slab reinforcement drawings to present the arrangement of slab reinforcement for submission.
2	<p>The input for TopMain_nominal, TopDistribution_nominal, BottomMain_nominal & BottomDistribution_nominal shall be "HXX-XXX" while "H" is a must, XX is the longitudinal reinforcement diameter and XXX is the spacing of longitudinal reinforcement (e.g. H32-150)</p> 
3	<p>The input for Stirrups shall be “HXX-XXX-XXX” while "H" is a must, XX are the transverse reinforcement diameter, 1st XXX is the longitudinal spacing of transverse reinforcement and 2nd XXX is the transverse spacing of transverse reinforcement.</p> <ul style="list-style-type: none"> • Indicate the longitudinal spacing (main direction) and follow with transverse spacing (distribution direction) (e.g. H8-100-100)

	Greenery	NParks	<u>Conservation of Trees / Plants (Tree Protection Specifications)</u> <ul style="list-style-type: none"> The Certified Arborist engaged by the Developer is to provide a report of the trees to be conserved, with indication of the tree girth (minimum tree protection zone will be generated in CORENET X) A Tree Protection Zone (TPZ) refers to an area identified to protect the entire tree, which includes its crown, trunk and roots system. The TPZ established should be able to protect the entire tree throughout the duration of construction. The objective of the TPZ is to minimize the impact of construction activities on trees, including but not limited to mechanical injury to roots, trunks and branches due to contact with equipment, materials, debris or other activities. It also aims to minimize compaction of soil, which results in poor functioning of roots, and changes in soil levels that can cut off or suffocate roots.

Modeling Tree in IFC-SG

- As long as relevant IFC-SG requirements are embedded in the tree object, it is okay to model trees as simplified lollipop BIM components. We are mindful that more elaborate tree models can increase the file size of the BIM model.

Wall

Modeling Wall in IFC-SG

- All the wall elements shall be modelled in IFC-SG model with the necessary information required as stipulated in the tables below.
 - Typical wall are allowed to have same marks and design information. The marks and design information have to be embedded in every wall element.
 - Multiple wall elements shall be modelled from storey to storey for continuous wall.
 - Civil defence shelter wall will need to be indicated as “Yes” in IFC-SG parameter “ShelterUsage” and substantiate with civil defence shelter reinforcement details in 2D drawings.
- 2D detail drawings are allowed for any irregular or complex wall section (e.g. L shape wall, D wall, retaining wall, etc.) with the indication of drawing number in the IFC-SG parameter “ReferTo2DDetail”.

Wall Dimension and Reinforcement Definition

Column Dimension and Reinforcement Definition
